Key Takeaways: Disorders that Involve Anxiety Part 1

0:00 / 3:55

This course focuses on helping you to be able to:

Learning objective: Discuss the diagnostic criteria, prevalence, contributing factors, and cultural influences for each of the disorders that involve anxiety.

1. Diagnostic criteria: Though the diagnostic criteria for each disorder vary, they all involve the experience of anxiety that is more extreme than would be expected by our diathesis alone. In addition, the level of anxiety is sufficient to cause distress, potential derangement, and/or adverse, and significant impairments in daily life, including social, occupational, and other important areas.
2. Prevalence: Anxiety disorders are the most common types of psychological disorders world-wide, especially. The affected adult, globally without treatment, or anxiety disorder (sometime in their lives. The global lifetime prevalence of safe, panic disorder, and specific phobia is 4.1%, 2.7%, and 7%, respectively. Social anxiety disorder is the most common anxiety disorder in the United States, with a 12% prevalence.
3. Contributing factors: Though there may be small differences between disorders, anxiety disorders generally result from a combination of biological and environmental factors. Evidence suggests that there is a heritable component to some anxiety disorders as is filial (some individuals) and biological (psychological) temperament (e.g., behavioral inhibition). Learning theory views of the brain known as the fear circuitry play a major role in the experience of anxiety.
 a. A variety of environmental factors can influence the development of anxiety disorders. Exercise in long-lasting ones can increase the likelihood that a child will experience anxiety. In addition, classical and operant conditioning can potentially create anxious responses. Finally, cognitive distortions can influence the development and maintenance of anxiety disorders. Each of these factors can negatively impact the experience of anxiety, especially disorders characterized by it.
4. Cultural influences: Research has shown that the experience of anxiety and the development of anxiety disorder suffer between Western and non-Western cultures. For some disorders there are significant differences in the experience of anxiety such that in non-Western cultures, individuals experience physical manifestations of anxiety more than in Western cultures.
 a. Many cultures also experience anxiety in ways that are culture-specific and clinicians must take cultural factors into consideration when working with clients from diverse backgrounds.

Now that you're finished reviewing these key takeaways, you can head over to the material in these three modules or move on to Mark the Module Quiz. Remember to use the information you just learned when you study for the quiz. Good luck!
