Instructions

1. **Having difficulty concentrating and appraising the seriousness of a stressor are [BLANK] symptoms of anxiety.** 1 / 1 point

● cognitive
○ emotional
○ behavioral
○ physiological

Nice work

Stressors can have significant impacts on our ability to think as we would if not faced with a stressor. At times, our mind can go blank, we might have difficulty concentrating or forming complete sentences, and our problem-solving ability decreases. But we are also likely to engage in a cognitive process in which we consider the seriousness of the stressor and decide whether we can meet its demands.

2. **Feeling scared and nervous are [BLANK] symptoms of anxiety.** 1 / 1 point

○ physiological
○ cognitive
○ behavioral
● emotional

Nice work

Situations that we find dangerous or frightening elicit emotions such as anxiety and fear. Anxiety and fear may manifest as feeling tense and uneasy, apprehensive and scared, or distressed and terrified, depending on how dangerous the situation is. These emotional responses might also be characterized as a feeling of dread.

3. **Being restless and exhibiting social withdrawal are [BLANK] symptoms of anxiety.** 1 / 1 point

● behavioral
○ cognitive
○ emotional
○ physiological

Nice work

When faced with a stressful event we are likely to consider either running away or staying and facing the stressor. Stressors also result in behavioral responses such as restlessness, rocking back and forth, and making hand gestures.

4. **Experiencing muscle tension and headaches are [BLANK] symptoms of anxiety.** 1 / 1 point

● physiological
○ behavioral
○ emotional
○ cognitive

Nice work

Muscle tension and headaches are common physiological symptoms of anxiety. Stressors also result in physiological responses such as dizziness, upset stomach, breathing issues, and elevated heart rate and blood pressure.
