Instructions

1. **Which nervous system can be divided into the sympathetic and parasympathetic nervous systems?** 1 / 1 point

○ Central
● Autonomic
○ Somatic
○ Sensory

✓ Nice work

The autonomic nervous system has two components, the sympathetic nervous system and the parasympathetic nervous system. The sympathetic nervous system (SNS) functions like an alarm system, triggering the fight-or-flight response.

2. **Which nervous system component is responsible for the release of adrenaline?** 1 / 1 point

○ Somatic
○ Parasympathetic
● Sympathetic
○ Central

✓ Nice work

The sympathetic nervous system functions like an alarm system, triggering the fight-or-flight response. One part of this response is the release of adrenaline, which increases heart rate, circulation, and breathing, and increases carbohydrate metabolism producing more sugar to give the body energy.

3. **Which nervous system component is responsible for decreasing heart rate after a stressful event?** 1 / 1 point

○ Somatic
● Parasympathetic
○ Sympathetic
○ Central

✓ Nice work

Once a stressor has stopped, the parasympathetic nervous system takes over, calming and reversing the bodily changes triggered by the sympathetic when the body was on high alert. The PNS evokes a rest-and-digest response that focuses the body on long-term maintenance.

4. **Which of the following is NOT one of the four components of anxiety?** 1 / 1 point

● Relational
○ Cognitive
○ Emotional
○ Physiological

✓ Nice work

The four components of anxiety are cognitive, emotional, physiological, and behavioral.

5. **The sense of dread is associated with the [BLANK] component of anxiety.** 0 / 1 point

○ emotional
● physiological
○ cognitive
○ behavioral

⊗ Try again

6. **In response to a stressor, your heart rate increases, your pupils start to dilate. You are ready for action. This response is part of the [BLANK] component of anxiety and is associated with the [BLANK] nervous system.** 1 / 1 point

○ behavioral; parasympathetic
● physiological; sympathetic
○ behavioral; sympathetic
○ physiological; parasympathetic

✓ Nice work

The fight-or-flight response is a pattern of physiological changes elicited by activity of the sympathetic nervous system in response to threatening or otherwise stressful situations that leads to mobilization of energy for physical activity.

7. **Mei Lin does not enjoy hanging out with her friends. She has reasoned with herself that her friends do not like to be around her and she's worried that additional contact will cause her friends to push her away. Thus she has turned down many invitations to gather with her friends. This situation is best attributed to the [BLANK] components of anxiety.** 1 / 1 point

○ emotional and physiological
● behavioral and cognitive
○ behavioral and emotional
○ emotional and cognitive

✓ Nice work

For Mei Lin, hanging out with her friends has become stressful. It has produced changes in thoughts and a certain degree of worry and a decision to change her behavior.

8. **The rest-and-digest response is attributed to the** 1 / 1 point

○ central nervous system.
● parasympathetic nervous system.
○ sympathetic nervous system.
○ somatic nervous system.

✓ Nice work

Once a stressful experience has passed, the parasympathetic nervous system (PNS) takes over, calming and reversing the bodily changes triggered by the SNS when the body was on high alert. The PNS evokes a rest-and-digest response that focuses the body on long-term maintenance.

9. **The ability to take action in the face of a stressful and threatening event is attributed to the** 1 / 1 point

○ central nervous system.
○ parasympathetic nervous system.
● sympathetic nervous system.
○ somatic nervous system.

✓ Nice work

The sympathetic nervous system (SNS) functions like an alarm system, triggering the fight-or-flight response. When the SNS is activated, a number of physical changes occur, all aimed at helping prepare the body for dealing with a stressor.

10. **Carlos has been feeling irritable as the date for his medical school entrance exam draws closer. He's been constantly wondering what might happen if he does not do well on the exam. This situation is best attributed to the [BLANK] components of anxiety.** 1 / 1 point

○ physiological and behavioral
● emotional and cognitive
○ cognitive and physical
○ behavioral and emotional

✓ Nice work

Stressful situations elicit emotions such as anxiety, fear, and feelings of restlessness and often lead to cognitions including worry about the potential negative consequences of an event.
